Our design centers around the adaptive quality of a slender shelving unit. Three parts make up the unit. First are the stud walls that retreat and pocket when not in use. Secondly, there are varied lengths of shelving that also have built-in storage. The third part is the pipe tracking with which the stud braces run and attach along. The pipe is cut and has within it a rope LED lighting. The lighting allows not just for illumination for the periodicals but also facilitates the lighting of the wall, when exposed, for posters and announcement display.

This design uses adaptability, variation, ease of use, economy, and detailed intention to create a wall with an ever-changing presence.
